

# Unsupervised prediction

Jeffrey Leek, Assistant Professor of Biostatistics Johns Hopkins Bloomberg School of Public Health

# **Key ideas**

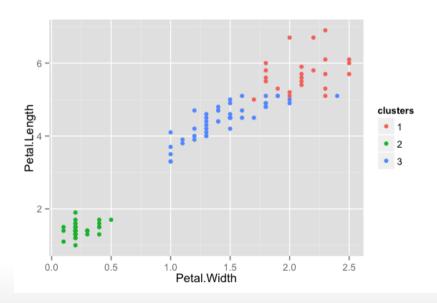

- · Sometimes you don't know the labels for prediction
- · To build a predictor
  - Create clusters
  - Name clusters
  - Build predictor for clusters
- · In a new data set
  - Predict clusters

### Iris example ignoring species labels

```
[1] 45 5
```

#### **Cluster with k-means**

```
kMeans1 <- kmeans(subset(training,select=-c(Species)),centers=3)
training$clusters <- as.factor(kMeans1$cluster)
qplot(Petal.Width,Petal.Length,colour=clusters,data=training)</pre>
```

### Compare to real labels

table(kMeans1\$cluster,training\$Species)

virginica	versicolor	setosa	
23	1	0	1
0	0	35	2
12	34	0	3

# **Build predictor**

```
modFit <- train(clusters ~.,data=subset(training,select=-c(Species)),method="rpart")
table(predict(modFit,training),training$Species)</pre>
```

#### Apply on test

```
testClusterPred <- predict(modFit,testing)
table(testClusterPred ,testing$Species)</pre>
```

```
testClusterPred setosa versicolor virginica
1 0 0 13
2 15 0 0
3 0 15 2
```

#### Notes and further reading
